## PSY30100-03 -- Assignment 10

Two-Way Tables

TA: Laura Lu
April 26, 2010

## A joke

$\square$ Here is a joke I heard days ago.
"Every human being's brain has two parts: the left and the right. The left brain has nothing right. The right brain has nothing left."

## Problem

There are a two-way table:

|  | Smoker | Not |
| :--- | :--- | :--- |
| Dead | 139 | 230 |
| Alive | 438 | 502 |

## Questions

1. Row variable? Column variable?
2. Marginal distributions in percentage for both variables.
3. Conditional distributions of survival given smoking status.
4. Carry out a test on relationship between the two variables.
5. Conclusion.

## Ans. of Q.1-2

|  |  | Smoking status |  | marg. dist. |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Smoker | Not | Total | Per. |
| Survival <br> status | Dead | 139 | 230 | 369 | $28.2 \%$ |
|  | Alive | 438 | 502 | 940 | $71.8 \%$ |
| marg. <br> dist. | Total | 577 | 732 | 1309 |  |
|  | Per. | $44.1 \%$ | $55.9 \%$ |  | $100 \%$ |

## Ans. of Q. 3

Conditional distributions of survival given smoking status

|  | Smoker | Not |
| :--- | :--- | :--- |
| Dead | $24.1 \%<$ | $31.4 \%$ |
| Alive | $75.9 \%>$ | $68.6 \%$ |
| total | $100 \%$ | $100 \%$ |

## Ans. of Q. 4

Expected Cell Count $=\frac{\text { rwo tatal } \times \text { column total }}{\text { total count }}$

|  | Smoker | Not | Total |
| :--- | :--- | :--- | :--- |
| Dead | 139 <br> $(E=162.7)$ | 230 <br> $(E=206.3)$ | 369 |
| Alive | 438 |  |  |
| $(E=414.3)$ | $(E=525.7)$ | 940 |  |
| Total | 577 | 732 | 1309 |

## Ans. of Q. 4

$$
\begin{aligned}
& \sum_{\text {all cells }} \frac{(\text { Observed }- \text { Expected })^{2}}{\text { Expected }} \\
= & \frac{(139-162.7)^{2}}{162.7}+\frac{(230-206.3)^{2}}{206.3} \\
+ & \frac{(438-414.3)^{2}}{414.3}+\frac{(502-525.7)^{2}}{525.7} \\
\approx & 8.6
\end{aligned}
$$

The table is $2 \times 2$, so there are $(2-1)(2-1)=1$ degrees of freedom.
And the critical value for $\chi_{1}^{2}$ at alpha $=0.05$ is 3.84 .
Therefore, we reject HO .

## Ans. of Q. 5

$\square$ Conclusions:
$\square$ 1. Smoking status is significantly associate with survival status at the alpha level of 0.05 .
$\square$ 2. Smokers have a lower death rate than non-smokers.

## Ans. of Q.6: Age 18-44

|  |  | Smoking status |  | marg. dist. |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Smoker | Not | Total | Per. |
| Survival <br> status | Dead | 19 | 13 | 32 | $5.1 \%$ |
|  | Alive | 269 | 327 | 596 | $94.9 \%$ |
| marg. <br> dist. | Total | 288 | 340 | 628 |  |
|  | Per. | $45.9 \%$ | $54.1 \%$ |  | $100 \%$ |

## Ans. of Q.6: Age 18-44

Conditional distributions of survival given smoking status

|  | Smoker | Not |
| :--- | :--- | :--- |
| Dead | $6.6 \%>$ | $3.8 \%$ |
| Alive | $93.4 \%<$ | $96.2 \%$ |
| total | $100 \%$ | $100 \%$ |

## Ans. of Q.6: Age 45-64

|  |  | Smoking status |  | marg. dist. |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Smoker | Not | Total | Per. |
| Survival <br> status | Dead | 78 | 52 | 130 | $29.6 \%$ |
|  | Alive | 162 | 147 | 309 | $70.4 \%$ |
| marg. <br> dist. | Total | 240 | 199 | 439 |  |
|  | Per. | $54.7 \%$ | $45.3 \%$ |  | $100 \%$ |

## Ans. of Q.6: Age 45-64

Conditional distributions of survival given smoking status

|  | Smoker | Not |
| :--- | :--- | :--- |
| Dead | $32.5 \%>$ | $26.1 \%$ |
| Alive | $67.5 \%<$ | $73.9 \%$ |
| total | $100 \%$ | $100 \%$ |

## Ans. of Q.6: Age 65+

|  |  | Smoking status |  | marg. dist. |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Smoker | Not | Total | Per. |
| Survival <br> status | Dead | 42 | 165 | 207 | $85.5 \%$ |
|  | Alive | 7 | 28 | 35 | $14.5 \%$ |
| marg. <br> dist. | Total | 49 | 193 | 242 |  |
|  | Per. | $20.2 \%$ | $79.8 \%$ |  | $100 \%$ |

## Ans. of Q.6: Age 65+

Conditional distributions of survival given smoking status

|  | Smoker | Not |
| :--- | :--- | :--- |
| Dead | $85.7 \%>$ | $85.5 \%$ |
| Alive | $14.3 \%<$ | $14.5 \%$ |
| total | $100 \%$ | $100 \%$ |

## Ans. of Q. 7

$\square$ Conclusion:
$\square$ For each age subgroup, non-smokers have a lower death rate than smokers.

## Ans. of Q. 8

$\square$ Simpson's Paradox!
$\square$ The variable age is a lurking variable in this problem.

## Ans. of Q. 9

- Take-home message:
$\square$ Lurking variables can strongly influence relationships between categorical variables. An association or comparison that holds for all subgroups can reverse direction when lurking variables are ignored and the data are combined to form a single group.
$\square$ In this problem, when age is ignored, smokers seem to have a lower death rate, even though non-smokers do have a lower death rate in each of three age subgroups.

## Another take-home message:

$\square$ Stay away from smoking, drugs, or other unhealthy habits. I hope you have a healthy body, and enjoy your life.
$\square$ Although we don't have perfect brains, I do hope you have perfect scores on your final examination.
