		$\psi$ 0.25	0.2078	0.0422	0.1686	0.0511	0.0420	0.0044	0.6830	

<sup>a</sup> The true value of the corresponding parameter.

<sup>b</sup> The average of the estimate of the corresponding parameter across 1000 replications.

<sup>c</sup> The absolute bias of the estimate.

<sup>d</sup> The relative bias of the estimate.

<sup>e</sup> The empirical s.e. across 1000 replications.

<sup>f</sup> The average of the s.e. obtained from the model.

<sup>g</sup> The mean square error of the estimate,  $MSE = Bias.abs^2 + SE.emp^2$ .

<sup>h</sup> The coverage probability of the estimate.

<sup>i</sup> The maximum of the convergence code across 1000 replications.

<sup>j</sup> The method of pooling likelihood functions.

<sup>k</sup> Parameters are estimated by maximizing the exact likelihood function of the original data.

<sup>l</sup> Parameters are estimated by maximizing the conditional likelihood function of the original data.

<sup>m</sup> The method of pooling data (connecting data directly).

Table 2: The results summarized from 1000 replications of the data  
of  $N = 50$  individuals with each having  $T = 5$  observations and a fixed  $y_1 = 0$
